

**Overview of Appendix 1**

- ❖ Table A - Default Closure Tables for Residential and Industrial Land Use Applications
- ❖ Table B - Chemical/Physical Properties
- ❖ Table C - Exposure Equations
- ❖ Table D - Exposure Assumptions
- ❖ Table E - Default Exposure Assumption References
- ❖ Table F - Human Health Toxicity Parameters
- ❖ Table G - Critical Toxic Effects and Categories

**A1.0 Introduction**

This appendix provides various tables of values needed to determine default closure levels under RISC. A short narrative describing each table is provided below; the tables are provided following the text.

**Table A**

Table A is divided into two main sections, Residential and Commercial/ Industrial. Each of these is further divided into two subsections, Soil and Ground Water. Each section presents applicable closure levels and footnotes.

Both the Industrial and Residential Soil Closure Level sections provide concentrations for soil saturation (C<sub>sat</sub>); soil attenuation capacity (SAC); and construction worker, direct, and migration to ground water pathways. A final column presents the Default Closure Level, as determined by the lowest of C<sub>sat</sub>; SAC; and construction worker, direct, or migration to ground water closure levels for a given chemical. Default closure levels are considered protective of human health.

The ground water section provides concentrations for water solubility limits, maximum contaminant levels (MCL), and the respective ground water pathway closure levels. The default closure level for residential settings is the MCL, if the MCL has been established; if not, the default closure level is the lowest of either the ground water pathway or the solubility limit. The ground water default closure level for the commercial/industrial setting is the solubility limit if it is lower than any other level; if not, the default closure level is the highest of either the MCL or the ground water pathway level.

The default closure levels for all compounds, except beryllium and mercury, are used over a default soil pH range of 6.0 to 8.0. If site soils have a pH within this range, the default closure levels can be applied. If not, a site-specific, pH-dependent closure level must be developed for any ionizing organics and metals at the site. The K<sub>d</sub>-dependent pH range applies only to metals and ionizing organics. These compounds are identified in the default closure level tables by footnote 6. In general, carboxylic acids, phenols, and amines are considered “ionizing organics.” For those metals or ionizing organics not included in the table, a pH-specific K<sub>oc</sub> or K<sub>d</sub> will need to be determined. Guidance for determining the K<sub>d</sub> or K<sub>oc</sub> is presented in the 1996 EPA Soil Screening Guidance (EPA 540/R-95/128). K<sub>d</sub> values for beryllium and mercury are very sensitive to slight changes

in pH; therefore, a site-specific pH must be established and used to determine the  $K_d$  for these compounds. This value can be calculated by using Table C-4, Metal  $K_d$  Values as a Function of pH, as presented in the EPA 1996 Soil Screening Guidance Users Guide (EPA/540/R-96-018).

**Table B**

Table B presents values for the following chemical and physical properties used to derive the values listed in Table A:

- Volatilization Factor
  - Diffusivity in air
  - Diffusivity in water
- $K_{oc}/K_d$
- Henry's Law Constant
- Dermal absorbance
- Water solubility
- Maximum contaminant level (MCL)
- Melting point
- Boiling point
- Molecular weight

The chemical and physical parameter values were taken from the following references (in order of preference):

1. EPA. 1996. Soil Screening Guidance Document, Users Guide, 9355.4-23, EPA/540/R-96/018, April; Technical Background Document, 9355.4-17A, EPA/540/R-95/128, May.
2. Agency for Toxic Substances and Disease Registry Toxicological Profiles
3. EPA Region 9, Region 6, and Region 3 Preliminary Remediation Goals, Physical and Chemical Parameters; available online at:  
<http://www.epa.gov/reg3hwmd/risk/riskmenu.htm>

4. Other EPA sources, including the Superfund Chemical Data Matrix
5. Other State agency sources
6. Other published literature

**Table C**

Table C presents mathematical equations used to derive closure levels. The RISC default process considers three media of exposure or pathways for commercial/industrial and residential land uses: surface soil, subsurface soil, and ground water. Subsurface soil is considered a medium because it presents a mechanism for contaminant transport to ground water when rain infiltrates and leaches material out of the soil. For this reason, the equations describing calculation of subsurface soil default closure levels are titled *Migration to Groundwater*; they are often referred to as “indirect” exposure pathway equations. The total exposure associated with each medium is the sum of the exposures from each significant absorption route (ingestion, dermal absorption, and inhalation) associated with that medium. The construction worker occupational exposure considers only soil exposure.

Residential and industrial direct soil exposure is determined by summing the intake from the ingestion, inhalation, and dermal absorption routes. Values listed for exposure resulting from soil contaminants migrating to ground water are protective for the ground water consumption pathway. Residential ground water exposure is determined by summing the intake from the inhalation and ingestion routes. Certain exposure routes in a given pathway were eliminated after considering potential exposure and dosage. The dermal route for residential ground water was assessed as an insignificant contributor to risk and was therefore eliminated from the calculation. Similarly, the inhalation route for industrial ground water was eliminated because industrial settings are typically well ventilated, and it is unlikely that most workers have any significant exposure.

Construction closure levels consider the intake from ingestion, dermal, and inhalation routes for direct soil contact. Water exposure was not considered because most utility or other construction work does not involve workers standing in water for long periods of time.

Separate equations are needed to determine carcinogenic and noncarcinogenic closure levels. Many compounds have both a carcinogenic and noncarcinogenic dose response. In such cases, each value was calculated separately, and the lowest result is used in the table.

Exposure to residential soil presents more significant exposure risks in children 6 years and younger. Children in this age group generally spend more time outdoors and ingest more soil than adults. To account for this special case, a “weighted approach” was used to calculate residential surface soil values. The body weight, exposure duration, skin-surface area, ingestion amounts, and inhalation rates were age-adjusted or “weighted” for each of the three principle soil absorption routes.

Five supporting models were used to account for the following factors: volatilization factor/particulate emissions, soil saturation, age adjustments for soil ingestion, skin contact, and vapor inhalation. The volatilization and particulate emission models account for exposure potential for emission of vapors and particulates from surface soils. The models and equations are taken from the EPA Soil Screening Guidance (1996). Similarly, the models used for soil saturation levels were also taken from the Soil Screening Guidance. The equations (models) used to adjust values based on age were mathematically derived using exposure duration, body weight, skin surface area, and ingestion and inhalation rates of children and adults.

### **Tables D and E**

Table D presents the Default Exposure Assumptions used in the equations presented in Table C. Quantification of exposure variables (such as exposure frequency, exposure duration, and exposed surface area) will change depending on land use, application, and whether the receptors are adults or children. Table E lists a reference source verifying each default value.

Generally speaking, the default assumption values are set at the 90 to 95<sup>th</sup> percentile of available and reliable data. This approach is more protective than using the average value and it is generally accepted as a reasonable working boundary on the population of sampled measurements (see EPA Risk Assessment Guidance for Superfund, EPA/540/1-89/002).

### **Table F**

Table F presents the reference doses and slope factors for all of the chemicals listed in the closure tables. These values were taken from the following references (in order of preference):

1.     EPA Integrated Risk Information System (IRIS) — Certain route-to-route extrapolations are acceptable. Guidance is presented below.

2. Health Effects Assessment Summary Tables (HEAST) — Assuming HEAST continues to be updated (if not, then this source moves to “Other Literature Sources”).
3. Agency for Toxic Substances and Disease Registry (ATSDR), National Center for Environmental Assessment, and EPA Regions 9 and 3 PRG Toxicity Values
4. Other literature sources — This may include derivations from literature sources.
5. Predictive Models — Predictive models such as Quantitative Structure and Activity Relationship (QSARS)

In general, the organic chemicals in the default tables have both an inhalation and an oral reference dose (RfD) or slope factor (SF). These values are taken directly from experimentally derived animal or human data (when available). When sufficient data on the route was not available, IDEM used a route-to-route extrapolation. This approach assumes that toxicity is similar for both routes. While it is unlikely that there is a direct 1-to-1 correlation between the inhalation and oral routes, extrapolation of inhalation RfDs from oral RfDs for the more volatile chemicals tends to be reasonably close when compared to experimentally derived inhalation RfDs (EPA Soil Screening Guidance 1996).

IDEM considers such extrapolations of values for the more volatile compounds to compare reasonably well and will use route-to-route extrapolations. As the volatility of the compounds decreases, route-to-route extrapolations become less certain (EPA Soil Screening Guidance 1996). However, these extrapolations do provide some assurance that the pathways are being addressed, and IDEM will also use route-to-route extrapolations for these compounds.

Route-to-route extrapolations do not work as well for inorganics. For the carcinogenic metals, specifically beryllium, chromium, nickel, and cadmium, the experimental evidence involving increased cancer risk appears to be limited to the respiratory pathway, and it is unlikely that ingestion would contribute to the carcinogenic response. Therefore, a route-to-route extrapolation has not been performed.

With respect to noncarcinogenic inorganics, considerable difference exists in the absorption and toxicity dynamics between routes. The differences are significant enough to eliminate them from consideration for route-to-route extrapolation. In addition, IDEM’s

analysis of these compounds at default particulate exposure levels indicates that the particulate inhalation pathway is insignificant. IRIS and EPA Regions 3, 6, and 9 do not perform route-to-route extrapolations for inorganics. IDEM agrees with EPA and will not include the route-to-route extrapolation as a pathway for inorganic compounds. Therefore, route-to-route extrapolations were not performed for noncarcinogenic inorganic compounds.

**Table G**

The RISC default approach uses the “critical effect” of a noncarcinogenic chemical to establish the target organ. The critical effect is the first adverse effect, or its known precursor, that occurs to the most sensitive species as the dose is increased during toxicity testing. Therefore, it is a toxic effect on a target organ or tissue (for example, an increase in liver weight or nephrotoxicity). Each critical effect will be categorized into one or more “critical effects categories.” A critical effects category is a group of target organs or tissues subject to common absorption or a group of organs with similar or common functions. In certain cases, an effect occurring in one system may indirectly affect another system, and it will be necessary to consider effects as additive within both systems. In other cases, a chemical at the RfD dose may affect more than one critical effects category. Many chemicals have both a carcinogenic and a noncarcinogenic toxic effect. If the default value in the closure table is based on the carcinogenic response, then the additivity of the chemical is assessed only as a carcinogen.

The box on the following page lists the 10 critical effects categories and examples of the target organs or effects considered in that category. The list of critical effects and categories for each chemical is given in Table G.

**Critical Effects Categories and Target Organs**

1. Systemic: Liver, kidney, urinary tract
2. Circulatory: Arteries, veins, heart, and blood
3. Gastrointestinal: Buccal cavity, esophagus, stomach, intestines, and gall bladder
4. Musculoskeletal: Muscles, bone, and connective tissues
5. Respiratory: Lungs, trachea, and nasal passageway
6. Immunological: Lymph and tissue fluid, spleen, and lymph nodes

- |   |
|---|
| 7. Neurological: Brain, spinal cord, and neurons<br>8. Reproductive/Endocrine: Testes, ovaries, thyroid, adrenal, pituitary, pancreas, and parathyroid<br>9. Developmental: Teratology, growth retardation, structural malformations, and abnormal development<br>10. Dermal/ Ocular: Skin and eyes |
|---|

The primary critical effect and target organ for each chemical was obtained using the following sources (in order of preference):

1. IRIS (EPA 2000)
2. HEAST (EPA 1997)
3. ATSDR Toxicological Profiles
4. Hazardous Substance Databank (<http://toxnet.nlm.nih.gov>)

Exceptions include the following critical effects and target organs:

- Some compounds have an RfD based on the No Observed Adverse Effects Level (NOAEL), and information on toxic effects at higher doses was not available. In these cases, the critical effect of a surrogate compound (similar in structure and type) was used.
- Some compounds have an RfD established with the NOAEL and some toxic effects information. The toxic effects information was used to establish the critical effect.
- Some compounds have experimentally derived oral and inhalation reference doses. Where these values were within an order of magnitude of each other, critical effects from both routes were listed. These compounds should be considered as additive in both categories.
- Some compounds did not have an easily identified target organ within the critical effects category. These compounds were classified within a category as “nonspecific.”

Table A Footnotes

1. The default values for certain compounds may be listed as a carcinogen in one column and a non carcinogen in another column. This is the result of calculating both a carcinogenic and noncarcinogenic response for a given chemical and taking the lowest of the two. If a compound has a “C” next to the concentration, then the closure level is evaluated from a carcinogen endpoint, and the compound should be treated as a carcinogen when considering additivity. If a compound does not have a “C” next to the concentration, then the closure level is evaluated from a non-carcinogen endpoint, and the compound should be treated as noncarcinogenic when considering additivity.
2. Certain chemicals that are not liquid at normal soil temperature will not have  $C_{sat}$  values.
3. Soil direct contact values are based on the potential for soil-plant-human uptake.
4. Construction values are listed as the raw calculated values. When applying construction values to closures, care should be taken to recognize that values will be capped at the SAC value (defaulted at 6000 mg/kg and 10,000 mg/kg for organics and metals, respectively) or the  $C_{sat}$  whichever is less. Direct contact and Migration to ground water closure levels are listed as the raw calculated values. When applying these values separately to closure care should be taken to recognize that these values may be capped at the SAC (defaulted at 6000/2000 or 10,000 for organics and metals, respectively), the  $C_{sat}$ , or the construction value, whichever is less. Site specific values for SAC and  $C_{sat}$  may be determined. The lesser of these values may then be used up to the raw calculated Construction or Direct/Migration values in these three columns. (note that non-default options also exist for changing the Direct/Migration columns See Chapter 7).
5. Acrolein, Bis(2-chloroethyl)ether, and N-Nitroso-di-n-propylamine may not have an analytical method available with a detection or quantitation limit able to meet the closure level for the matrix without modification. Appendix 2 should be consulted to verify analytical procedures.
6. Ionizing organics and metals Koc and Kd values will vary depending on pH. If the source area pH is outside of the range of 6.0-8.0 then see the discussion in Section A1.0, under “Table A”, pages A.1-1 and A.1-2.
7. Under certain circumstances a “trihalomethane” standard may apply to bromoform, chloroform, and bromodichloromethane. The composite standard may reduce the closure level.
8. Lead values were calculated using the:

1994 Integrated Exposure Uptake Biokinetic Model (see EPA/540/R-93/081, PB-963510) for residential exposures;

The Methodology for Assessing Risks Associated with Adult Exposures to Lead

in Soil, SRC-GLD-FO162-209-DRAFT-7/21/96, and;

Review of A Methodology for Establishing Risk-Based Soil Remediation Goals for Commercial Areas of the California Gultch Site, USEPA, Technical Review Workgroup for Lead, October 26, 1995 for industrial and construction exposures, and;

The Drinking Water Regulation and Health Advisories EPA 822-R-96-001, February, 1996 action levels for residential ground water, and an extrapolation to determine industrial ground water levels.

The Kd value for lead was taken from Sheppard and Thibault (Default Soil Solid Liquid Partition Coefficients , Kds for Four Major Soil Types: A Compendium, Health Physics Vol 59, No. 4, pp 471-482, 1990) for sandy soils and is considered to be applicable anywhere in the state. IDEM recommends site specific determinations and/or use of the Synthetic Precipitation Leaching Procedure (SPLP) for lead (see section 7.1.1).

9. Closure levels for beryllium and mercury must be determined with a site specific pH. See discussion in section A1.0 under Table A, pages A.1-1 and A.1-2.
10. Benzene values may soon change. IRIS has listed the slope factor for this compound as a range and IDEM is currently determining the application to closure levels
11. PCBs are assumed to be a mixture and that Aroclor 1016 and 1254 are present.
12. Chromium VI should be used to represent total chromium unless a species specific ratio evaluation is made.
13. Cyanide values apply to free cyanide only. The closure levels are not applicable to copper cyanide or other complexed cyanides. Total cyanides may not be representative of free cyanide.
14. The SAC value of 10,000 mg/kg for metals is a ceiling value that addresses the potential for a high level of one chemical to impact multiple chemical exposure in such a way that the combined effect is likely to be greater than the sum of the individual effects.
15. Table A lists default closure levels for individual chemicals only. Additivity or the potential for combined effects of multiple chemical exposure should be evaluated when there is more than one chemical present (see section 6.1 Chemical of Concern Additivity)

Above parameters are listed for 25°C and 760 mm Hg.

Footnotes

1. Cyanide as CN- is assumed to be non-volatile as it is in pH 6.8 soil and nonacidic water.

Key of terms

Di,a-diffusivity in air

Di,w-diffusivity in water

Koc-soil organic carbon-water partitioning coefficient

Kd-soil-water partition coefficient

H'-Dimensionless Henry's Law constant (a measure of the affinity of a compound to volatilize from water)

ABS-fraction absorbed through skin

S-water solubility

MCL-Safe Drinking Water Act maximum contaminant level

MP-melting point

BP-boiling point

MW-molecular weight

## **Table C**

Exposure Equations

Equation Number	Equation Name	Table C - Exposure Equations
A1-1	Residential Groundwater (Carcinogens)	$C_{gwrc} = \frac{TR \times BW_a \times AT_c \times 365 \text{ days/year}}{EF_r \times ED_r \times [(SF_o \times IngR_{raw}) + (SF_i \times InhR_{raa} \times K)]}$
A1-2	Residential Groundwater (Non-carcinogens)	$C_{gwn} = \frac{THQ \times BW_a \times AT_n \times 365 \text{ days/year}}{EF_r \times ED_r \left[ \left( \frac{IngR_{raw}}{RFD_o} \right) + \left( \frac{InhR_{raa}}{RFD_i} \times K \right) \right]}$
A1-3	Residential Soil Direct Contact (Carcinogens)	$C_{ssrc} = \frac{TR \times AT_c \times 365 \text{ days/year}}{EF_r \left[ \frac{SF_o \left( IngF_{adj} + (SFS_{adj} \times ABS) \right)}{10^6 \text{ mg/kg}} + InhF_{adj} \times SF_i \left( \frac{1}{VF} + \frac{1}{PEF} \right) \right]}$
A1-4	Residential Direct Contact (Non-carcinogens)	$C_{ssrn} = \frac{THQ \times AT_n \times 365 \text{ days/year}}{EF_r \left[ \left( \frac{IngF_{adj} + (SFS_{adj} \times ABS)}{RFD_o \times 10^6 \text{ mg/kg}} \right) + \frac{InhF_{adj}}{RFD_i} \left( \frac{1}{VF} + \frac{1}{PEF} \right) \right]}$
A1-5	Residential Soil Migration to GW (Carcinogens)	$C_{sbsrc} = C_{gwrc} \times 20 \left[ K_d + \frac{\theta_{wp} + (\theta_{ap} \times H')}{\rho_b} \right]$

Equation Number	Equation Name	Table C - Exposure Equations
A 1-6	Residential Soil Migration to GW (Non-carcinogens)	$C_{\text{sbsm}} = C_{\text{gwm}} \times 20 \left[ K_d + \frac{\theta_{wp} + (\theta_{ap} \times H')}{\rho_b} \right]$
A 1-7	Commercial / Industrial Groundwater (Carcinogens)	$C_{\text{gwic}} = \frac{TR \times BW_a \times AT_c \times 365 \text{ days/year}}{EF_i \times ED_i \times (SF_o \times IngR_{iaw})}$

InhR <sub>rca</sub>	Inhalation Rate Residential Child Air	10 m <sup>3</sup> /day
K	Indoor Volatilization Factor (Inhalation from volatiles in groundwater)	0.5 (unitless)
K <sub>d</sub>	Soil/Water Partition Coefficient(See Table B) K <sub>d</sub> = Table Values for Metals(See Table B) K <sub>d</sub> = K <sub>oc</sub> x f <sub>oc</sub> for Organics(See Table B)	Chemical Specific (l/kg) Chemical Specific (l/kg) Chemical Specific (l/kg)
K <sub>oc</sub>	Soil Organic Carbon/Water Partition Coefficient(See Table B)	Chemical Specific (l/kg)
l	Length of sampling interval	site specific
M	Soil to Skin Adherence Factor	0.5 mg/cm <sup>2</sup> -day
n	Number of site samples	Chemical Specific
NC	Non-carcinogen	Chemical Specific
NCL	Non-carcinogen Closure Level	Chemical Specific

Symbol	Parameter	Value
P <sub>b</sub>	Dry Soil Bulk Density	1.5 kg/l
PEF	Particulate Emission Factor (See Table C)	1.316 x 10 <sup>9</sup> m <sup>3</sup> /kg
P <sub>s</sub>	Soil particle density	2.65 g/cm <sup>3</sup>
Q/C <sub>vf</sub>	Inverse of the mean concentration at the center of a 0.5 acre source - volatilization factor	68.81 g/m <sup>2</sup> -s kg/m <sup>3</sup>
Q/C <sub>p</sub>	Inverse of the mean concentration at the center of a 0.5 acre source - particulates	90.80 g/m <sup>2</sup> -Sec kg/m <sup>3</sup>
RFD <sub>i</sub>	Reference Dose Inhalation	Chemical Specific (mg/Kg - day)
RFD <sub>o</sub>	Reference Dose Oral	Chemical Specific (mg/Kg - day)
s	Standard deviation of site sample set	Chemical Specific
S	Solubility in Water	Chemical Specific (mg/l-water)
SA <sub>cas</sub>	Surface Area Construction Exposed Adult Skin	3160 cm <sup>2</sup>
SA <sub>ias</sub>	Surface Area Commercial/Industrial Exposed Adult Skin	3160 cm <sup>2</sup>
SA <sub>ras</sub>	Surface Area Residential Exposed Adult Skin	5000 cm <sup>2</sup>
SA <sub>rccs</sub>	Surface Area Residential Exposed Child Skin	2000 cm <sup>2</sup>
SF <sub>i</sub>	Carcinogenic Potency Slope Inhalation	Chemical Specific (mg/Kg - day) <sup>-1</sup>
SF <sub>o</sub>	Carcinogenic Potency Slope Oral	Chemical Specific (mg/Kg - day) <sup>-1</sup>
SFS <sub>adj</sub>	Skin Factor Soil Age Adjusted (See Table C)	1257 mg-yr/kg-day
t	Students' t value corresponding to n at the 95% confidence level (one tailed test)	Chemical Specific
T	Exposure interval Volatilization Equation	9.5 x 10 <sup>8</sup> s
THQ	Target Hazard Quotient	1 (unitless)
TR	Target Risk	1 x 10 <sup>-5</sup> (unitless)
U <sub>m</sub>	Mean annual wind speed	4.69 m/s
U <sub>t</sub>	Equivalent threshold value of wind speed at 7 m	11.32 m/s
V	Fraction of vegetative cover	0.5 (unitless, = 50%)

Symbol	Parameter	Value
VF	Volatilization Factor (See Table C)	Chemical Specific m <sup>3</sup> /kg
$\bar{x}$	Average of site samples	Chemical Specific

CAS = Chemical Abstract Service

H = Heast

I = IRIS

N = NCEA

R = Route to Route Extrapolation

SFi = Inhalation Slope Factor

SFo = Oral Slope Factor

RfDi = Inhalation Reference Dose

RfDo = Oral Reference Dose

3,6,9 = EPA Regions 3,6,9 Screening Tables

PCB Slope Factor and RfD assume a mixture of PCB congeners including Aroclor 1016 and 1254.

**Table G**

Critical Effects

**TABLE G**  
**CRITICAL EFFECTS**

<b>Chemical</b>	<b>Critical Effects Category</b>	<b>Source</b>
	<b>Primary Critical Effect</b>	
Acenaphthene	Systemic (Liver)	IRIS
Acenaphthylene	Systemic (Liver)	Similar PAHs
Acetone	Systemic (Kidney, liver)	IRIS
Acrolein	Respiratory (Nasal passageway)	IRIS
Anthracene	Systemic (Liver)	Similar PAHs
Antimony	Circulatory (Heart) Systemic (Nonspecific)	IRIS
Barium	Systemic (Kidney)	IRIS
Benzoic acid	Systemic (Liver, Kidney) Respiratory (Trachea, Lung)	HSDB
Benzyl alcohol	Gastrointestinal (Forestomach)	HEAST
Butanol	Neurological (Central nervous system)	IRIS
Butylbenzyl phthalate	Systemic (Liver)	IRIS
Cadmium	Systemic (Kidney)	IRIS
Carbon disulfide	Neurological (Peripheral nervous system) Developmental (Nonspecific)	IRIS
4-Chloroaniline	Musculoskeletal (Connective tissue)	IRIS
Chlorobenzene	Systemic (Liver)	IRIS
Chloroethane (Ethyl Chloride)	Developmental (Growth Retardation)	IRIS
2-chloronaphthalene	Dermal/Ocular (Skin)	HSDB
2-Chlorophenol	Reproductive (Nonspecific)	IRIS
Chromium III	Respiratory (Lung)	ATSDR
Copper	Systemic (Liver/kidney) Circulatory (Blood)	ATSDR
Cyanide	Endocrine (Thyroid) Neurological (Neurons)	IRIS
Di-n-butyl phthalate	Developmental (Teratology)	IRIS
1,2-Dichlorobenzene	Systemic (Liver)	IRIS
1,3-Dichlorobenzene	Systemic (Liver)	1,2-Dichlorobenzene
1,1-Dichloroethane	Systemic (Liver, kidney) Neurological (Central nervous system)	HSDB HEAST
cis-1,2-Dichloroethene	Circulatory (Blood)	HEAST
trans-1,2-Dichloroethene	Circulatory (Blood)	IRIS
2,4-Dichlorophenol	Immunological (Lymph)	IRIS
Diethyl phthalate	Developmental (Teratology) <sup>2</sup>	IRIS
Dimethyl phthalate	Systemic (Kidney, liver)	HSDB
2,4-Dimethylphenol	Neurological (Central nervous system) Circulatory (Blood)	IRIS

<b>Chemical</b>	<b>Critical Effects Category</b>	<b>Source</b>
	<b>Primary Critical Effect</b>	
2,4-Dinitrophenol	Dermal/Ocular (eye)	IRIS
Di-n-octyl phthalate	Systemic (Liver) Immunological (Spleen) Developmental (Teratology)	HSDB
Endosulfan	Systemic (Kidney) Circulatory (Blood vessel)	IRIS
Endrin	Systemic (Liver)	IRIS
Ethylbenzene	Systemic (Liver, kidney) Developmental (Teratology)	IRIS
Fluoranthene	Systemic (Liver, kidney) Circulatory (Blood)	IRIS
Fluorene	Circulatory (Blood)	IRIS
Hexachlorocyclopentadiene	Gastrointestinal (Stomach)	IRIS
Lead	Neurological (Central nervous system)	ATSDR
Mercury	Neurological (Central nervous system) Systemic (Kidney)	IRIS
Methoxychlor	Developmental (Nonspecific)	IRIS
Methyl bromide (Bromomethane)	Gastrointestinal (Stomach) Respiratory (Nasal)	IRIS
Methyl ethyl ketone (2- Butanone)	Developmental (Nonspecific)	IRIS
4-Methyl-2-pentanone (Methyl isobutyl ketone)	Systemic (Liver, Kidney)	HEAST
2-Methylphenol	Neurological (Central nervous system)	IRIS
3-Methylphenol	Neurological (Central nervous system)	IRIS
4-Methylphenol	Neurological (Central nervous system) <sup>1</sup>	ATSDR
Naphthalene	Respiratory (Nasal)	IRIS
Nickel	Circulatory (Heart) Systemic (Liver) Immunological (Spleen)	IRIS
2-Nitroaniline	Circulatory (Blood) Systemic (Liver, kidney) Endocrine (Adrenals)	HEAST
Nitrobenzene	Systemic (Liver, kidney) Endocrine (Adrenals) Circulatory (Blood)	IRIS
Phenol	Developmental (Nonspecific)	IRIS
Pyrene	Systemic (Kidney)	IRIS
Selenium	Dermal/Ocular (Skin) Neurological (Central nervous system)	IRIS

<b>Chemical</b>	<b>Critical Effects Category</b>	<b>Source</b>
	<b>Primary Critical Effect</b>	
Silver	Dermal/Ocular (Skin)	IRIS
Styrene	Circulatory(Blood) Systemic (Liver) Neurological (Central nervous system)	IRIS
Thallium	Systemic (Liver)	IRIS
Toluene	Systemic (Liver, Kidney) Neurological (Central nervous system)	IRIS
1,2,4-Trichlorobenzene	Endocrine (Adrenal)	IRIS
1,1,1-Trichloroethane	Circulatory (Heart) Neurological (Central nervous system)	ATSDR
2,4,5-Trichlorophenol	Systemic (Liver, kidney)	IRIS
Vinyl acetate	Respiratory (Nasal)	IRIS
Xylenes	Neurological (Central nervous system)	IRIS
Zinc	Circulatory (Blood)	IRIS

#### **Critical Effects Categories and Target Organs**

1. Systemic: Liver, kidney, urinary tract
2. Circulatory: Arteries, veins, heart, and blood
3. Gastrointestinal: Buccal cavity, esophagus, stomach, intestines, and gall bladder
4. Musculoskeletal: Muscles, bone, and connective tissues
5. Respiratory: Lungs, trachea, and nasal passageway
6. Immunological: Lymph and tissue fluid, spleen, and lymph nodes
7. Neurological: Brain, spinal cord, neurons, and neuroglia
8. Reproductive/Endocrine: Testes, ovaries, thyroid, adrenal, pituitary, pancreas, and parathyroid
9. Developmental: Teratology, growth retardation, structural malformations, and abnormal development
10. Dermal/ Ocular: Skin and eyes

The primary critical effect and target organ for each chemical was obtained using the following sources (in order of preference):

1. IRIS (EPA 2000)
2. HEAST (EPA 1997)
3. ATSDR Toxicological Profiles
4. Hazardous Substance Databank (<http://toxnet.nlm.nih.gov>)

Exceptions include the following critical effects and target organs:

- Some compounds have an RfD based on the No Observed Adverse Effects Level (NOAEL), and information on toxic effects at higher doses was not available. In these cases, the critical effect of a surrogate compound (similar in structure and type) was used.
- Some compounds have an RfD established with the NOAEL and some toxic effects information. The toxic effects information was used to establish the critical effect.
- Some compounds have experimentally derived oral and inhalation reference doses. Where these values were within an order of magnitude of each other, critical effects from both routes were listed. These compounds should be considered as additive in both categories.
- Some compounds did not have an easily identified target organ within the critical effects category. These compounds were classified within a category as “nonspecific.”
